Covid-19 Vaccine Residual Analysis (C19VRA) - How it Works

Your blood contains information about every organ, gland, hormone, infection, toxin, etc...that is in your body in the form of a frequency. Since everything has a slightly different frequency, we can determine something as minor as an E. coli infection vs. E. albertii infection; your heart as a whole vs. your heart cells; your left knee vs your right knee.

In the case of the C19VRA, the various components in the injection as well as items within your cells can be looked at for presence and overall functionality. Some things should NOT be in your body. Some things should be functioning well. This method allows us to look for those frequencies that should not be in your body, like synthetic mRNA. We also look for disrupted frequencies, with your DNA, which should be working well.

There is a simple complexity in the method. It can be done very simply. It can be used with a number of different frequencies and based how they interact with each other, it gives us information about presence or not of a substance in a specific area of the body.

The method is fluid, just like our current times are fluid. Information and understanding continue to change and come out. We alter the method as that information and understanding direct us. The percentage of people with transmission in the Summer of 2024 (about 40%) is very different than the percentage of people with transmission in the Summer of 2025 (about 80%). The method must stay flexible because the world, especially many more synthetics being added are not stagnant.
